

ReviewCrew Lite

Quick Start guide. From download to your first free tech check in about 5 minutes.

0 Need

1 Install

2 Check

3 Run

4 Fix

How to use the yellow boxes: copy the text into Claude Code and replace the parts marked **like this** with your own. When Claude asks permission to run something (a command, a local server, reading a web page), choose **Allow**.

0 What you need

- **Claude Code:** the desktop app, the terminal app or an IDE extension, recently updated
- **A website:** a live link, a staging link, or a website folder on your computer. A live link is the easiest start
- **Only for a folder on your computer:** Python 3 (Mac usually has it; Windows: python.org, tick "Add python.exe to PATH")

1 Install (2 minutes)

1. **Unzip** the download (or clone the repository). You see a folder named `.claude` next to `README.md`.
 - Mac: `.claude` is hidden. Press **Cmd + Shift + .** in Finder to show it
 - Windows: View, then Show, then Hidden items

2. Copy it:

A. One website project

No `.claude` folder in your project yet: copy the whole `.claude` folder into it.

Already has one: copy `skills/site-tech-check` into its `skills` folder and `agents/site-tech-lead.md` into its `agents` folder.

B. All your projects

Windows: paste `%USERPROFILE%\claude` in the File Explorer address bar. Mac: Finder, **Cmd + Shift + G**, paste `~/claude`.

Copy `skills/site-tech-check` into `skills` and `agents/site-tech-lead.md` into `agents`.

Mac warning: never drag `.claude` onto an existing `.claude` folder. Finder replaces the whole folder and deletes your own Claude settings. Copy only the folder and file named above.

3. **Start a new Claude Code session** in that folder. Skills and agents only load when a session starts.

One critic of five: Lite checks the technical side only, not design, real user tasks, SEO and copy, or your offer. The full ReviewCrew pack adds those four critics (link in the README).

2 Check it works (1 minute)

PASTE IN CLAUDE CODE

List the skills and agents available in this project. Do not run any of them.

You should see the skill **site-tech-check** and the agent **site-tech-lead**.

3 Your first check

LIVE SITE

Run a tech check on **https://your-site.com**. The goal is **booking a call**.

WEBSITE FOLDER ON YOUR COMPUTER

Run a tech check on the website in the folder **site** in this project. The goal is **newsletter sign-ups**.

Claude asks a short question if something is unclear, runs the critic, checks every finding itself and gives you a scorecard. It is saved in `.claude/site-review/rounds/`.

4 Read the scorecard and fix

Score (out of 10)	Meaning
1 to 3	Broken: blocks the goal, or a security or data risk
4 to 5	Works, but loses many visitors
6 to 7	Decent, with clear leaks
8	Solid. The bar for "ready"
9 to 10	Excellent to best in class

Nothing on your site changes during a check. You choose what to fix:

FIX WHAT YOU PICKED

Fix items **1 and 2** from the latest tech check. Show me each change before you move on.

CHECK YOUR FIXES

Check the tech fixes again. We fixed items **1 and 2**.

? If something goes wrong

Problem	Fix
Claude does not know site-tech-check	Check the files are in <code>.claude/skills/</code> and <code>.claude/agents/</code> , not inside an extra folder. Start a new session
"Could not run the command"	You probably denied a permission prompt. Ask again and choose Allow
My site needs a login	The critic cannot log in. Use a public staging link or the website folder
"Address already in use"	Tell Claude: <i>use port 8090 instead</i>
